What does sync do on android. Sync feature android app. How does sync work on android. Auto sync feature on android.

The Dashlane password management application provides a new function that allows you to create, record and synchronize passwords on smartphones with a new Android 14 operating system. The familiar version of the developer of the published developer Last month adds new functions to Android, which allow passwords of passwords from other companies to use the connection with compatible applications on the platform. The attackers extort users' access because there is no password for the flight. After authentication, a computer, a smartphone or a special secure hardware device, such as Yubikey, completes the connection with a password using biometric data, such as facial ID, fingerprint scanners digital or PIN code. Apple, Google and Microsoft have introduced passwords and build them directly into their operating systems. Companies cooperate to improve the comfort of use - they have even agreed to use the same name. Until now, Dashlane and other similar managers have not been able to connect directly with smartphone equipment and a safe key access system at the operating system. It is difficult to compete with Apple and Android password managers built in the scope of the generation of passwords. Dashlane already supports the access keys in Computer Chrome via the extension, while the Rival 1Password announced a multiplatform access key with a universal connection. However, users using the latest version of the overview of the Android 14 developer can now easily create access keys to external suppliers, such as Dashlane, provided that it is defined as a default password manager in the settings. Dashlane published a film on Twitter showing how this process works, showing how the operating system relieves third pages, such as Dashlane. Dashlane explains on her blog how it works as follows: during the generation of the access key, Dashlane generates an asymmetrical pair of keys, safely storing the private key in the user memory and returning the key public on the trust page. (Website recording application or password). When you connect with a password, the confidence part sends a request to sign a private key by Dashlane and sends the answer to authenticate the user. The Dashlane mobile application still cannot be used in a web browser, only applications. However, the company expects this feature to be available in another familiarization version before the official version of Android 14. Users' invasion is based on Dashlane in the range of access keys, requires a Long path, because it requires creators of applications and websites. In But that's not just the problem of Dashlane, This is really a problem for all members of the Fido alliance who all work hard to get people to switch from passwords to access keys. If you have problems with your Google account with synchronization, a message may be reported that says: "We have problems with synchronization. It will continue." Or will be displayed.
